The following is an examiner's statement of reasons for allowance:

USP 6954701 discloses that all water treatment processes include a large assortment of strategically placed sensors that are typically incorporated into a computer system capable of comparing the sensor values against a pre-set quality level. In a preferred embodiment, the sensors are micro-sensors that incorporate chemically selective sensors and physical measurement devices on a single chip of silicon or other functional material that can chemically profile a sample as small as a drop. In a preferred embodiment the sensors include a communications interface effective for real time data transmission, such as a Lonworks.RTM. network variable interface. Suitable sensors would include the Six-CENSE.TM. and CT-CENSE.TM. manufactured by Dascore, Inc., as well as the multi-sensor devices manufactured by Sensicore, Inc. Critical water parameters to be measured include, but are not limited to, dissolved oxygen, pH, and oxidation-reduction potential.

USP 6609070 discloses that typically, many different instruments are required to measure the parameters of wastewater. Maintaining these individual components and tracking the data from these individual components is cumbersome. For example, pH meters and ORP meters, etc., are all used to monitor and track the quality of wastewater. Moreover, most water treatment monitoring systems comprise an assortment of individual meters and gauges. These individual components are

not integrated. Further, PLCs also do not have the ability to obtain data directly from water treatment sensors such as pH, ORP, etc. This means that an additional meter or transmitter has to be installed between the PLC and the appropriate sensor. A discrete signal is often sent from a relay output on a meter to a discrete input on the PLC. Alternatively, an analog signal may be sent from the meter to an analog input on the PLC. Use of meters in addition to the PLC means additional expense, additional wiring, and additional programming since the meter will have to be programmed for alarm set points and alarm deadband. In summary, current PLCs are used primarily for control. They tend to be difficult if not impossible to use for calculating, manipulating, displaying or storing data. They cannot be used to obtain input directly from most water treatment sensors. In conventional monitoring systems, it is common to have a number of separate meters monitoring the analytical parameters. Each of these meters may then produce an analog output, which is recorded by some type of control device, such as a PLC. Many PLCs are designed having interchangeable input/output modules. These modules plug into a "rack" or a piece of hardware with multiple connections to some type of data bus, much like the ISA slots in a personal computer. However, in the case of analytical parameters such as pH, oxidation reduction potential (ORP), conductivity, dissolved oxygen, turbidity, corrosion rate, specific ion, etc., conventional systems monitor these parameters with separate discrete instruments. These instruments then send a signal, usually some type of analog signal, to a

standard input module on the PLC. Presently available systems do not have input/output modules for analytical parameters available for standard PLCs.

USP 6569336 describes a process of measuring the following parameters: the pH, oxidation-reduction potential, on previously aerated water, and possibly the dissolved oxygen on the water treated by the biomass. From these measurements and in real time the monitoring unit acts on different adjustment mechanisms in order to adjust the operational conditions best adapted to the correct operation of the ecosystem in the reactor where the biological reaction takes place with the biomass.

USP 5608171 describes a distributed, unattended wastewater monitoring system that uses advances in low-energy signal processing and distributed microelectromechanical systems and that involves wireless interrogation of distributed, low-power, normally-off sensors. In a preferred embodiment, a plurality of flowmeter stations and at least one rain gauge station are networked through a base station for storm water discharge or infiltration-inflow monitoring. Wireless transceivers are used to transmit radio signals into and out of a sewer manhole.

The prior art fails to teach or to render obvious a batch wastewater treatment method having a programmable aerator sequencer in which process a controller acquires in the controller respective data waveforms from three sensors (pH, DO, ORP) and control status data of the programmable sequencer; analyzes the data in the

controller, and performs an alarm process in the controller when a deviation from a previously fixed normal state is discovered as a result of the analysis. Accordingly, claim 1 is allowable. Claims 2 – 10 are allowable for the same reasons as claim 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
